Changing Definitions Of Medical Terms To Cover Shot Results.

October 5, 2021

Changing definition of terms

In response the CDC and WHO have taken to changing the definition of medical terms rather than admit that the shots are not working / doing what is needed. Two prime examples are the changing definition of herd immunity and of a vaccine. See below

Herd immunity (WHO definition) prior to January 2021:

- “Herd immunity is the indirect protection from an infectious disease that happens when a population is immune either through vaccination or immunity developed through previous infection.” Notice the comment on previous infection – This was a big part of how herd immunity was achieved.

Herd immunity (WHO definition) after 2021 was changed to:

- “Herd immunity’, also known as ‘population immunity’, is a concept used for vaccination, in which a population can be protected from a certain virus if a threshold of vaccination is reached. Herd immunity is achieved by protecting people from a virus, not by exposing them to it.
- Notice the removing of any reference to prior infection and natural immunity. Now “Herd Immunity” can only be achieved through vaccination.
- The WHO goes further to state that “Vaccines train our immune systems to create proteins that fight disease, known as ‘antibodies’, just as would happen when we are exposed to a disease but – crucially – vaccines work without making us sick. Vaccinated people are protected from getting the disease in question and passing it on, breaking any chains of transmission.”

Based on this definition, the ‘Shots’ are not vaccines as they do not protect people from getting the disease nor do they keep people from passing it on. So according to the WHO the shots are not vaccines.

Vaccine Definitions (CDC) Prior to Sept 1, 2021

- **Vaccine:** A product that stimulates a person’s immune system to produce immunity to a specific disease, protecting the person from that disease.
- **Vaccination:** The act of introducing a vaccine into the body to produce immunity to a specific disease.
- **Immunization:** A process by which a person becomes protected against a disease through vaccination. This term is often used interchangeably with vaccination or inoculation.
- **Immunity:** Protection from an infectious disease. If you are immune to a disease, you can be exposed to it without becoming infected

Vaccine Definitions (CDC) After Sept 1, 2021

- **Vaccine:** A preparation that is used to stimulate the body’s immune response against diseases.
 - *notice the removal of “produce immunity”*
- **Vaccination:** The act of introducing a vaccine into the body to **produce protection** from a specific disease.
 - *notice the removal of immunity it now protect but doesn’t provide immunity.*
- **Immunization:** A process by which a person becomes protected against a disease through vaccination. This term is often used interchangeably with vaccination or inoculation.
- **Immunity:** Protection from an infectious disease. If you are immune to a disease, you can be exposed to it without becoming infected

Please let us know what else we can do for you.
